

# **Your tattoo has Saniderm on it (adhesive, stick on plastic-like bandage):**

The ideal amount of time to leave this bandage on is around 6 to 7 days.

Plasma, blood and/or ink will potentially build up under bandage, this is normal.

If any liquid leaks out of the bandage onto your skin and the bandage remains compromised (it continues to leak or is now loose on the skin) you must remove bandage. Also if any part of the tattoo becomes exposed to the air in any way, you must remove bandage.

Although this bandage IS waterproof, if water from showering enters the bandage and is in contact with your tattoo, you must remove bandage. Even though this is waterproof, you must still avoid soaking in bodies of water like baths, rivers, oceans, lakes ect.

If and when you remove the bandage, remove it under running water to ease the removal, using unscented liquid antibacterial hand soap to wash it immediately after.

If bandage was removed before 6 to 7 days follow first set of instruction listed above.

After removal continue to wash tattoo 3 times daily and apply lotion when needed. All product information is listed in first set of instructions.

If redness, irritation, pain or bumps occur around the shape of the bandage, you might be having a slight allergic reaction. Remove bandage immediately and wash with very warm water and antibacterial hand soap and the irritation should go away within a couple hours. If irritation persists, consult your tattoo artist immediately.
